63

WHAT ARE WE PROTECTING AGAINST?

- Hardware failure
- Software failure
- Corruption
- Attack/DoS
- Regulatory requirements

64

WHAT CAN WE DO?

- Copy it somewhere else
- Have previous point-in-time copy
- The point is we can mitigate using different options depending on the threat
- Often, we will have both to address different needs

65

WHAT CAN WE DO?

- Copy it somewhere else
 - Replication
- Have previous point-in-time copy
 - Backup
 - Snapshot

Often not interchangeable as address different types of requirement

66

WHAT ARE WE PROTECTING AGAINST?

- Hardware failure - Replication
- Software failure - Replication
- Corruption – Backup/Snapshot
- Attack/DoS – Isolated export/backup/other
- Regulatory requirements – Backup

67

KNOWING THE SERVICES THAT MUST BE PROTECTED AND THEIR DEPENDENT SERVICES

- Understanding the systems that are key to your business is critical as they MUST be protected
- What tiers are they made up of and where is state?
- Understand the services that the key systems are dependent on is critical as they MUST be protected
- Understand the “nice to have”
- Understand the systems/access to use and control the environment which are REQUIRED

68

ASYNCHRONOUS VS SYNCHRONOUS REPLICATION

- Asynchronous – Transactions are committed on primary as created and then sent to secondary as fast as possible
 - No real impact to primary performance
 - Risk of data loss in unplanned failure
- Synchronous – Transactions are not committed on primary until acknowledged on the secondary
 - Can impact primary performance
 - No risk of data loss
- Asynchronous is used cross-site because of latency in nearly all scenarios

70

UNDERSTANDING AZURE RESOURCE SUPPORT FOR RESILIENCY CONSTRUCTS

- Some Azure services are global and resilient against any regional failure
 - Azure AD, Front Door, Traffic Manager
- Most are deployed to a specific region where different options are available
 - Regional
 - [Zone-redundant](#)
 - [Zonal](#)
- Make sure all components match and don't cross resiliency boundaries for dependencies

71

MULTI-REGION DEPLOYMENTS

- For true resiliency deploy to at least two regions
- [Azure regions are paired](#) for serialized platform updates
- This could be active/passive or active/active
- Ensure all core elements are available in other regions (don't be wasteful)
- Some resources cannot move between regions, e.g. public IP
- Need to balance between regions
 - Azure Traffic Manager, Azure Front Door, Global Load Balancer, DNS

73

WHAT'S THE PREFERENCE FOR REPLICATION?

- Native application/service multi-master
- Native application replication to standby (hot or warm)
- Hyper-V Replica at VM level (possible to Azure with Azure Site Recovery)
- In-OS replication (e.g. Mobility Service via ASR)
- Storage replication that is used by a Failover Cluster spanning locations or just making data available in Azure
 - Storage Spaces Direct (S2D)
- Restoring a backup/VM
- Not having any and leaving industry in disgrace

74

Remember

If there is no state does it need replicating?

Just have process to create as needed via IaC

75

WHAT ABOUT VM REPLICATION?

- From on-premises to Azure two solutions via Azure Site Recovery (ASR)
 - Hyper-V VMs – Hyper-V Replica
 - VMware VMs or physical – Mobility Service (in-guest)
- Azure to Azure via ASR
 - Uses mobility service via extension
- Can have recovery points (app consistent) including multi-VM consistency groups

76

WE DON'T PICK ONE

- We pick the highest one for EACH of the elements we need for DR!
- It's far better to have the best option for each type than a single "lowest common denominator" technology
- This means some extra considerations for management and failover but worth it!
- Processes can still be automated across technologies with recovery plans
- Cost should be considered as difference between replication to storage than replication to a running VM in Azure!

77

CLUSTERING IN AZURE IAAS

- Needed for solutions such as SQL AlwaysOn both in Azure and in hybrid scenarios
- Complicated as Azure does not allow IP's to float between VMs
- Common was to use a load balancer but in Server 2019 can use a distributed network name (DNN) instead for CNO
- Cloud Witness uses a storage account
- Shared disk supported IF shared storage required

78

DR PLANNED VS UNPLANNED

- There are really 3 types of DR failover
- Planned
 - "A storms coming, lets move our systems to the DR location"
 - Should be no data loss or unexpected outage
- Unplanned
 - "Where did that storm come from and where has the datacenter gone?"
 - May be data loss and longer outage depending on replication and process
- Test
 - "Lets test a failover process, while not affecting production, in case there is a storm one day"

79

AZURE BACKUP

- At the simplest level Azure also provides backup services via recovery vaults
- These can be used by backup applications and many Azure components (including VMs via extension)
- Data can then be recovered when needed
- Delta-based storage with many recovery points
- Retention settings enable day, week, month and year retention goals
- Vaults can have local, zone-redundant or geo-redundant configuration

80

SERVICE BACKUP & SNAPSHOTS

- Some services utilize their own backup technologies, e.g. Azure SQL Database, PostgreSQL
- Some utilize snapshots such as Azure Files (which can be managed by Azure Backup)
- Azure Blob has snapshot and soft delete
- Azure Block Blob also has object replication
- May need custom solution
